HRIVNÁK, R., The plant communities of *Phragmitetalia* in the catchment area of the Ipel' river (Slovakia and Hungary) 2. Tall-sedge dominated wetlands (*Magnocaricion elatae*). Biologia, Bratislava, 59: 457—476, 2004; ISSN 0006-3088.

During the research of marsh vegetation in 1995–2002 in the catchment area of the Ipel' river, 10 vegetation units of tall-sedge dominated wetlands were detected. The occurrence of *Caricetum elatae*, which had been published by several authors in the previous decades, was not confirmed. On the contrary, the occurrence of the *Caricetum melanostachya* association, the *Galio palustris-Caricetum ripariae* association, the *Carex pseudocyperus* community and the *Carex cespitosa* community have not been mentioned in the literature so far. The synmorphological, synecological and synchorological characteristics are presented for each vegetation unit.

Key words: *Phragmitetalia*, tall-sedge dominated wetlands, plant communities, phytosociology, Ipel' river, Slovakia, Hungary.

### Introduction

This paper is a continuation of an article, which was published in the previous issue of Biologia (HRIVNÁK, 2004). The general description of the studied area and methodology used are identical in both papers.

### Results and discussion

#### Survey and description of vegetation units

*Phragmito-Magnocaricetea* KLIKA in KLIKA et NOVÁK 1941  
*Phragmitetalia* KOCH 1926  
*Magnocaricion elatae* KOCH 1926

#### 11. *Carex pseudocyperus* community

The stand with the dominance of *Carex pseudocyperus* was found in an artificial biotope – a flooded gravel ditch, between stands of *Typhetum latifoliae* and *T. laxmannii*. The water regime is fluctuating during the vegetation period. The bottom is formed by gravel or sand. The neutral pH value (7.05) of water was detected. The floristic composition, ecology and type of biotope are very different from the characteristics of *Cicuto-Caricetum pseudocyperi* in Slovakia (cf. HRIVNÁK, 2001). As a result, the stand was classified as the *Carex pseudocyperus* community within the *Magnocaricion elatae* alliance. Similar stands are known, e.g., from England (cf. RODWELL, 1995). This stand is characterised by the following relevé.

Table 9A. *Caricetum acutiformis*.

## 12. *Caricetum elatae* KOCH 1926

Despite rather numerous relevés from this area, published between the late 50s and early 70s (MÁTHÉ, 1956; KOVÁCS, 1957; KOVÁCS & MÁTHÉ, 1967; SVOBODOVÁ & ŘEHOŘEK, 1972), no stands were found during the recent research of wetlands in the catchment area of the Ipeľ river. Many wetlands were destroyed or drained in 70s and 80s. Therefore, appropriate biotopes for this community almost disappeared nowadays.

### 13. *Caricetum acutiformis* EGGLER 1933 (Tabs 9A–B)

*Caricetum acutiformis* is a typical community of the littoral of stagnating waters, and deeper terrain depressions within large marshes. Besides that, it grows occasionally in bays bordered by fen alder woods (the *Alnetalia glutinosae* R. Tx. 1937 order). It forms small patches or relatively large stands in colline, rarely planare belts. The soils are clayey or peaty. The water regime is slightly fluctuating. In the Nature Reserve Ružinské jelšiny, a

neutral reaction of water (pH 6.5) was detected.

*Carex acutiformis* is a dominant species, marsh and wet meadow plants (e.g. *Lythrum salicaria*, *Lycopus europaeus*, *Lysimachia vulgaris* or *Ranunculus repens*) are frequent. Five floristical and ecological variants (Tab. 9B) were defined using the phytosociological material from the studied area:

- the marsh variant, poor in species (column A),
- the variant with a frequent occurrence

Table 10A. *Caricetum intermediae*

of marsh species in combination with some wet meadow species (column B),

- the variants with a frequent occurrence of wet meadow species (columns C–D),
- the variant with the presence of mesophilous and wet meadow species (column E).

*Caricetum acutiformis* belongs to relatively frequent communities in Slovakia (HRIVNÁK, 2001) as well as in the studied area. Although the *Caricetum acutiformis* association was mentioned from the Novohrad region in Hungary, there is no previous information from the catchment area of the Ipeľ river (cf. MÁTHÉ, 1956; KOVÁCS, 1957; KOVÁCS & MÁTHÉ, 1967).

#### *Caricenion gracilis* (NEUHÄUSL 1959) OBERD. et al. 1967

#### 14. *Caricetum intermediae* STEFFEN 1931 (Tabs 10A–B)

In the catchment area of the Ipeľ river, *Caricetum intermediae* belongs to very rare plant communities. Nowadays, the stands of *Caricetum intermediae* grow only in the complex of marshes in the alluvium of Ipeľ river near the Kiarov village and Šahy town. In the previous decades, this community was more frequent (SVOBODOVÁ & ŘEHOREK, 1972).

It forms stands relatively richer in species than the other tall-sedge dominated ones. Besides the diagnostic species of the *Phragmito-Magnocaricetea* class, wet meadow species (the *Molinietalia* KOCH 1926 and *Potentillo-Polygonetalia* R.TX. 1947 orders) are present. In the Table 10B, four floristical and ecological variants are present:

- the marsh variant (column A),
- the variant with the presence of diagnostic species of the *Molinietalia* order, which grows on the border of marshes and wet meadows (column B),
- the variants with a higher frequency of diagnostic species of the *Potentillion anserinae* R. Tx. 1947 and *Cnidion* BALÁTOVÁ-TULÁČKOVÁ 1966 alliances (columns C–D).

*Caricetum intermediae* is characteristic of well-developed soils with a higher content of alkaline cations, good quality of humus and neutral to moderately alkaline soil reaction (VICHEREK, 1973; BALÁTOVÁ-TULÁČKOVÁ, 1976; BALÁTOVÁ-TULÁČKOVÁ et al., 1993). These facts are also supported by the results from the catchment area of the Ipeľ river (MINÁR & MICHLIÁN, 1968).

On the territory of Slovakia and Hungary, *Caricetum intermediae* is considered endangered plant community (BORHIDI & SÁNTA, 1999; HRIVNÁK, 2001).

#### 15. *Caricetum gracilis* ALMQUIST 1929 (Tabs 11A–B)

The stands of *Caricetum gracilis* grow in shallow terrain depressions of alluvia of brooks and rivers, eulittoral and supralittoral of water reservoirs, ditches or ponds. Soil characteristics and water regime are highly variable in the catchment area of the Ipeľ river, as well as on the territory of Slovakia. The soils are loamy to clayey, rarely also sandy, the soil reaction ranges from acidic to slightly alkaline, the limose and terrestrial ecophases dominate during the vegetation period (CIGÁNKOVÁ & KRAJČI, 1967; KOVÁCS, 1968; MINÁR & MICHLIÁN, 1968; SVOBODOVÁ & ŘEHOREK, 1972; MIADOK, 1973; HRIVNÁK, 2001).

*Caricetum gracilis* forms closed and large stands, which are relatively rich in species. The floristic composition of this community is quite variable. Besides the presence of typical marsh species, wet and mesophilous meadow species are frequent. The variability of *Caricetum gracilis* in the studied area is presented in the Table 11B:

- variants with the combination of marsh and wet meadow species (columns A–C; variants B

Table 10B. *Caricetum intermediae* – Synoptic table.

Leg.: Ca – constancy, Cb – constancy according to HRIVNAK (2001)

\* BI – *Bidentetea tripartiti*, Co – *Convolvuletalia sepium*, E0 – moss layer, GU – *Galio-Urticetea*, MA – *Molinio-Arrhenatheretea*, O – Other species, PM – *Phragmito-Magnocaricetea*

*Caricetum gracilis* is the most frequent tall-sedge dominated wetland plant community in the catchment area of the Ipel river in Slovakia, as well as in Hungary (cf. Tab. 11B, MATHÉ 1956). It is relatively frequent in both countries (BORHIDI & SANTA, 1999; HRIVNÁK, 2001).

#### 16. *Caricetum vesicariae* CHOUARD 1924 (Tabs 12A–B)

*Caricetum vesicariae* forms small patches in the littoral of oxbows, as well as in deeper terrain depressions in the alluvia of brooks and rivers. The stands grow in a stagnating or slowly flowing water. As in the case in *Galio palustris-Caricetum ripariae*, the stands are adapted to flooding for a longer time. The soils are clayey, mesotrophic and eutrophic, moderately acid (SZENASIOVÁ, 1977).

This community forms mainly closed stands, rarely open stands poor in species. The variability of *Caricetum vesicariae* in the catchment area of the Ipel river is presented in the Table 12B.

Besides typical marsh species, the wet meadow species of the *Molinietalia* order are present. Four floristical and ecological variants are defined:

- variant with the presence of wet meadow species (Tab. 12B, column A),
- marsh variants with different diagnostic species (Tab. 12B, columns B–D).

*Caricetum vesicariae* has scattered occurrence from the planare to colline belts in the southern part of Slovakia and in the Duna-Tisza territory in Hungary (HRIVNÁK, 2001; BORHIDI & SANTA, 1999).

#### 17. *Galio palustris-Caricetum ripariae* BALÁTOVÁ-TULAČKOVA in BALÁTOVA-TULAČKOVA et al. 1993 (Tabs 13A–B)

In the catchment area of the Ipel river, *Galio palustris-Caricetum ripariae* belongs to the most frequent plant communities nowadays. The stands grow in the littoral of natural and artificial biotopes in a stagnating or slowly flowing water.

Table 12A. *Caricetum vesicariae*.

<i>Sympyton officinale</i>	.	.	.	.	.	+	+	.	r	.	.	.	.	.

This community forms large stands which have a good ability to occupy new artificial biotopes (e.g. littorals of gravel or sand ditches, artificial water reservoirs, margins of water-courses of brooks and rivers). The water regime is fluctuating, the water level sinks below the soil surface in the summer. A long-term duration of littoral ecophase and a relatively high level of flooding are typical for this community (cf. HEJNÝ & HUSÁK, 1978). The soils are loamy to clayey.

*Carex riparia* is the dominant species of this community. It forms closed stands poor in species. Besides *Carex riparia*, only four species occur with a higher frequency than 40% (see Tab. 13B). The variability of *Galio palustris-Caricetum ripariae* in the studied area is presented in the Table 13B. There are seven floristical and ecological variants:

- variant of the moderately salted biotopes, with the presence of the diagnostic species of the *Potentillion anserinae* alliance (column A),
- variant with the presence of wet meadow and weed species (column B),
- marsh variants, with the presence of the diagnostic species of the *Phragmitetalia* order (columns C–E),
- variant of shallow waters and drying biotopes, with the presence of the diagnostic species of the *Oenanthon aquatica* alliance (column F),

– variant with the presence of aquatic macrophytes (column G).

In littoral biotopes, *Galio palustris-Caricetum ripariae* is frequently in contact with reed wetland communities (e.g. *Glycerietum aquatica* HUECK 1931 or *Typhetum latifoliae* LANG 1973).

It is interesting that data on the occurrence of this community are fully absent in older phytosociological records from the catchment area of the Ipeľ river (cf. MÁTHÉ, 1956; KOVÁCS, 1957; KOVÁCS & MÁTHÉ, 1967; SVOBODOVÁ & ŘEHOREK, 1972).

#### 18. *Caricetum vulpinae* VON SOÓ 1927 (Tabs 14A–B)

The stands of *Caricetum vulpinae* grow in shallow terrain depressions on alluvia of rivers and brooks. The water regime of this community is varies. The biotopes are characterised by short-term floods with a low water level, decreasing rapidly below the soil surface (cf. e.g. BALÁTOVÁ-TULÁČKOVÁ, 1968, 1976; SVOBODOVÁ & ŘEHOREK, 1972). *Caricetum vulpinae* forms open stands, in which marsh and wet meadow species occur. The variability of this community is presented in the Table 14B, where six floristical and ecological variants are defined:

- typical marsh variant (column A),
- variants with the presence of the diagnostic

Leg.: Ca – constancy, Cb – constancy according to HRIVNAK (2001)

\* MA – Molinio-Arrhenatheretea, O – Other species, PM – Phragmito-Magnocaricetea

species of the *Potentillo-Polygonetalia* R. Tx. 1947 order (columns B and C), – variants with the presence of wet meadow species (columns D and E), mainly the diagnostic species of the *Molinietalia* KOCH 1926 order (column D),

– variant with the presence of mesophilous meadow species (column F). *Caricetum vulpinae* occurs frequently in the planare and colline belts on the territory of Slovakia (HRIVNÁK, 2001).

#### 19. *Caricetum melanostachya* BALÁZS 1943

The stands were detected on the alluvia of lowland rivers and brooks, along the borderlines between marshes and wet meadows. This fact influences the floristical composition of this community, where the species of the Phragmito-Magnocaricetea class, and the *Molinietalia* KOCH 1926 and *Potentillo-*

*Polygonetalia* R.Tx. 1947 orders occur together. Along with the dominant species *Carex melanostachya*, only four taxa (*Alopecurus pratensis*, *C. vulpina* agg., *Phalaroides arundinacea*, and *Ranunculus repens*) have a high constancy (more than 70%). HRIVNÁK (1999, 2000) published seven phytosociological relevés from the planare belts of the Lučenská and Ipel'ská kotlina basins and presented a detailed information about the synmorphology, synecology and chorology of this community. Afterward, only one new locality of this community was found (see rel. 5).

In the study area, *Caricetum melanostachya* belongs to very rare marsh plant communities. Besides the localities in the catchment area of the Ipeľ river, this community was reported from the Východoslovenská nížina lowland (HEJNÝ & HUSÁK, 1978) and the eastern part of the Poduna-

## Conclusions

In the catchment area of the Ipeľ river, tall-sedge dominated wetlands are documented by 10 plant communities. Mesotrophic plant communi-

ties of *Caricenion rostratae* are very rare nowadays. *Caricetum elatae* which was very frequent in the half of the last century has not been recorded during this research. On the other hand, eutrophic plant communities of *Caricenion gracilis* are frequent. There are 8 vegetation units, which are documented by almost 100 recent relevés. The *Carex pseudocyperus* community was included in the higher syntaxonomical unit, *Magnocaricion elatae*. Its floristic composition and structure are different from *Cicuto-Caricetum pseudocyperi*, which grows in the drifts of organic materials in stagnating, mesotrophic or eutrophic waters in Europe (cf. HEJNÝ & HUSÁK, 1978).

The duration and height of floods are the most important factors for the formation and development of tall-sedge wetlands, as well as all marsh plant communities. These factors (along with the nutrient status of soil, soil structure and pH, management of stands and others) have impact on floristical composition and structure of the stands. The detected floristical and ecological variants of plant communities from the studied area are presented in the tables marked with B. For this

Table 14B. *Caricetum vulpinae* – Synoptic table.

## Appendix 2: Localities of relevés

Note: For the published data, only the country, orographical unit, locality and the cited paper where the relevé was published are presented. For other relevés, the header data are listed in the following order: country (SK – Slovakia, HU – Hungary); orographical unit (CV – Cerová vrchovina Mts, IK – Ipelšká kotlina basin, IP – Ipelšká pahorkatina Mts, KP – Krupinská planina Mts, LK – Lučenská kotlina basin, O – Ostrôžky Mts, RV – Revúcka vrchovina Mts, RK – Rimavská kotlina basin; VV – Veporské vrchy Mts.); locality and habitat; flow classes (S – stagnant, F – flow, – – without water); depth of water (cm); altitude (m); aspect (S – south, E – east, N – north; W – west); slope (°); relevé area ( $m^2$ ); total cover (%);  $E_1$  cover (%);  $E_0$  cover (%); mean height of stand (cm); proportion of dead biomass (%); author(s) of relevé (PB – P. BALÁZS, AC – A. CVACHOVÁ, RH – R. HRIVNÁK, HO – H. OTAHELOVÁ, MV – M. VALACHOVIČ); date.

Table 9A.

1. SK; LK; Veľká nad Ipľom village, W margin of village, alluvium of Ipel river; –; 0; 165; 0; 0; 25; 100; 100; 0; 100–120; 40–50; RH; 4.5.2000.
2. SK; LK; Lučenec town, NW bank of a water reservoir Ľadovo; –; 0; 203; 0; 0; 25; 100; 100; 0; 80–100; 0; RH; 9.6.1998.
3. SK; IK; Slovenské Klačany village, NE, alluvium of Tisovník brook near road Veľký Krtíš town – Lučenec town; S; 0–3; 194; 0; 0; 25; 100; 100; 0; 120–140; 20–30; RH; 19.7.1999.
4. SK; LK; Poltár town, SE margin of the town, terrain depression on the alluvium of Poltárica brook near railway; S; 1–7; 231; 0; 0; 25; 100; 100; 1; 100–110; 0; RH; 22.7.1999.
5. SK; RV; Ružiná village, S, NR Ružinské jelšiny; S; 1–3; 235; 0; 0; 25; 100; 100; 0; 140–160; 0; RH; 3.8.1999.
6. SK; IK; Ipelšké Predmostie village, W margin of village, near field-road; –; 0; 129; SW; 1; 25; 100; 100; 0; 105–115; 60; AC, RH, HO; 24.6.1997.
7. SK; LK; Lučenec town, under a road viaduct; S; 1–8; 192; 0; 0; 25; 80; 80; 0; 75–90; 20–30; RH; 2.6.1998.
8. SK; LK; Hrabovo village, NR Pod Šťavicou, ESE margin; –; 0; 195; 0; 0; 25; 90; 90; 0; 90–105; 25–30; RH; 8.6.1998.
9. SK; LK; ibid., Ipel river oxbow near road to spring of mineral water; –; 0; 203; WSW; 2; 24; 100; 100; 0; 100–115; 40; RH; 8.6.1998.
10. SK; LK; Veľké Dravce village, water reservoir, tributary area; –; 0; 197; 0; 0; 25; 100; 100; 0; 90–100; 0; RH, HO, MV; 30.7.1998.

11. SK; LK; Mikušovce village, near an irrigation station; –; 0; 180; 0; 0; 100; 100; 0; 95–110; 30–40; RH; 5.8.1998.

12. SK; LK/RK; Oždany village, littoral of a water reservoir; S; 0–2; 201; 0; 0; 25; 100; 100; 0; 90–110; 50; RH; 8.7.1999.

13. SK; CV; Šíd village, WSW, alluvium of Čamovský potok brook; –; 0; 201; 0; 0; 25; 100; 100; 0; 70–90; 15; RH; 13.8.1999.

14. HU; –; rhalom village, NW, alluvium of Ipel river; –; 0; 142; 0; 0; 17,5; 100; 100; 0; 100–130; 60; PB, RH; 13.6.2000.

15. SK; CV; Šíd village, WSW, alluvium of Čamovský potok brook; –; 0; 201; 0; 0; 25; 100; 100; 0; 140–150; 30–40; RH; 13.8.1999.

16. SK; LK; Trenč village, W, near road Lučenec – Bušince; –; 0; 165; 0; 0; 25; 100; 100; 0; 85–100; 0; RH; 25.5.1999.

17. SK; IK; Ipelšké Predmostie village, E, alluvium of Ipel river; –; 0; 130; 0; 0; 25; 100; 100; 0; 85–90; 0; AC, RH, HO; 24.6.1997.

18. SK; RV; Ružiná village, S, near NR Ružinské jelšiny; S; 0–5; 235; 0; 0; 25; 100; 100; 0; 90–120; 0; RH; 3.8.1999.

### Appendix 3: Resources of relevés in synoptic table

Table 9B.

A – [Tab. 9A: rels 1, 17]; B – [Tab. 9A: rels 2–12, 14–15]; C – [Tab. 9A: rels 13, 16, 18]; D – [SZÉNASIOVÁ (1975: Tab. 15, rels 2–6)]; E – [SZÉNASIOVÁ (1975: Tab. 15, rels 1, 7)].

Table 10B.

A – [KOVÁCS & MÁTHÉ (1967: Tab. 9, rels 1–2)]; B – [SVOBODOVÁ & ŘEHOREK (1972: Tab. 4, rels 4–6)]; C – [SVOBODOVÁ & ŘEHOREK (1972: Tab. 4, rels 1–3, 7–10)]; D – [Tab. 10A, rels 1–4].

Table 11B.

A – [Tab. 11A: rels 4–8, 10–12, 14–15, 17–24, 26–27; SVOBODOVÁ & ŘEHOREK (1972: Tab. 5, rel. 1)]; HRIVNÁK (1999: Tab. 2, rels 8–9); HRIVNÁK et al. (2001: Tab. 3, rels 33–34); B – [KOVÁCS & MÁTHÉ (1967: Tab. 8, rel. 4); SVOBODOVÁ & ŘEHOREK (l.c.: Tab. 5, rels 2–10, 12–13, 20)]; C – [KOVÁCS & MÁTHÉ (l.c.: Tab. 8, rels 1–3, 5); SVOBODOVÁ & ŘEHOREK (l.c.: Tab. 5, rels 11, 14–19)]; D – [Tab. 11A, rels 1–2, 9, 16, 25; SZÉNASIOVÁ (1975: Tab. 20, rels 1–5, 11–14, 21)]; E – [SZÉNASIOVÁ (l.c.: Tab. 20, rels 16–20)]; F – [MIADOK (1973: Tab. 2, rels 1–2, 7, 9–10); SZÉNASIOVÁ (l.c.: Tab. 20, rels 6–10, 15)]; G – [Tab. 11A, rels 3, 13; MIADOK (l.c.: Tab. 2, rels 3–6, 8)].

Table 12B.

A – [Tab. 12A: rel. 13; SZÉNASIOVÁ (1975: Tab. 10, rels 1–7, 11)]; B – [SZÉNASIOVÁ (1975: Tab. 10, rels 8–10, 12–13)]; HRIVNÁK (1999: Tab. 2, rel. 10)]; C – [Tab. 12A: rels 5, 7–12; HRIVNÁK et al. (2001: Tab. 3, rel. 43)]; D – [Tab. 12A: rels 1–4, 6, 14].

Table 13B.

A – [Tab. 13A: rels 1–4]; B – [Tab. 13A: rels 9–10, 12, 15; HRIVNÁK (1999: Tab. 2, rel. 12)]; C – [Tab. 13A: rels 5, 11, 13, 16–19; HRIVNÁK (1998: Tab. 2, rel. 7); HRIVNÁK (1999: Tab. 2, rel. 11)]; D – [Tab. 13A, rels 6–8; HRIVNÁK et al. (2001: Tab. 3, rel. 39)]; E – [Tab. 13A, rels 14, 25, 27; HRIVNÁK et al. (2001: Tab. 3, rels 40–41)]; F – [Tab. 13A, 21–24]; G – [Tab. 13A, rel. 26; HRIVNÁK et al. (2001: Tab. 3, rel. 41)].

Table 14B.

A – [Tab. 14A, rels 5, 7; HRIVNÁK (1999: Tab. 2, rels 13–14)]; B – [KOVÁCS & MÁTHÉ (1967: Tab. 10, rel. 1); SVOBODOVÁ & ŘEHOREK (1972: Tab. 6, rels 1–11)]; C – [Tab. 14A, rels 2, 4, 6; KOVÁCS & MÁTHÉ (1967: Tab. 10, rel. 2); SVOBODOVÁ & ŘEHOREK (1972: Tab. 6, rels 12–20)]; D – [Tab. 14A, rel. 3; MIADOK (1973: Tab. 4, rel. 5)]; SZÉNASIOVÁ (1975: Tab. 25, rels 1–7, 9–10)]; E – [Tab. 14A, rel. 1; MIADOK (1973: Tab. 4, rels 1–3)]; F – [MIADOK (1973: Tab. 4, rel. 4)]; SZÉNASIOVÁ (1975: Tab. 25, rels 8, 11)].
